above: Lapointe Discovery - Tres-Or technical team proceeding with extracting 50 tonnes of kimberlite to process for macro-diamonds

Tres-Or Resources Limited is a Canadian exploration and development company focused on diamond, precious, and base metals projects in Canada's mining triangle, known for its long history of mineral exploration and production success. The projects lie between Timmins–Kirkland Lake–Sudbury in Ontario, and Rouyn-Noranda to Ville Marie in Quebec.

Tres-Or's main diamond focus is the Lapointe Kimberlite Discovery, approximately 70 kilometres southeast of Timmins; it is the largest diamond-bearing kimberlite ever found in Ontario and sparked the largest staking rush in this area in Ontario's history.

The Lapointe Kimberlite is more than 21 hectares and contains multiple intrusive phases. Each phase has the potential to carry a different diamond grade. Diamonds have been found in all phases of the pipe, making this discovery a significant open-pit opportunity for Tres-Or.

The company is conducting a large tonnage test (extraction of 50 tonnes of kimberlite) to recover macrodiamonds (0.5 mm or larger) and to verify the course size distribution within the pipe.

Led by President and Chief Executive Officer Laura Duffett, Tres-Or management recognized early on that to move forward with certainty, the company needed a strong relationship with the nearby Aboriginal community, as the company's projects are situated in the Timiskaming First Nation's (TFN) traditional territorial lands, a significant historical area. The company consulted with the TFN from the initial staking and early exploration of its projects and this on-going consultation led to the signing a five-year Memorandum of Understanding (MOU) on exploration and development. This is an important step in Tres-Or's long-term planning, as it is the only company in the region to have signed a comprehensive MOU agreement, thus increasing Tres-Or's potential for successful development in the region.

Timiskaming First Nation Chief Conrad Polson and Tres-Or President Laura Lee Duffett - Signing and renewing of 5-year Memorandum of Understanding in the spirit of cooperation- Sept 2007 3. Candace Polson of Timiskaming First Nation - Traditional Youth Dance Group

“Tres-Or management recognized early on that to move forward with certainty, the company needed a strong relationship with the nearby Aboriginal community”

To further strengthen its relationship with the TFN and its community members, the company developed an employment base and utilizes a local qualified workforce to staff its operations. Tres-Or has assembled a very strong technical team, which has developed proprietary GIS databases for the region, and is exploring for diamonds and multiple precious and base metals that occur in the area.

The company screens for 30 multi-elements and kimberlite indicator minerals in every till sample collected. If there is an anomaly related to mineralization, the team will find it.

In addition to its Lapointe project, Tres-Or operates its wholly-owned Temagami diamond project (also in Ontario) that covers up to 80,000 hectares. The company has collected thousands of samples and completed a 10,500 line kilometre airborne magnetic survey of the area. This property hosts multiple indicator mineral dispersion trains, but Tres-Or is focused on indicator trains where diamonds have been recovered. Tres-Or assembled a large land package up ice from where it collected a diamond in till. Studies indicate that the diamond has moved only three to four kilometres, while the company's land continues up ice for 55 kilometres. The unknown diamond-bearing kimberlite source is likely on Tres-Or's Temagami project claims.

In Quebec, Tres-Or holds five kimberlite bodies discovered by drilling, and is exploring the Notre-Dame zinc-copper-gold property. The company recently completed 350 metres of drilling within a buried volcanic belt of over 10 kilometre strike length. Initial assays include 14.62 metres grading 2% zinc, including 2.38 metres of 3.39% zinc.

Immediate follow-up drilling is proceeding in 2008. The Mann platinum/palladium project, located 46 kilometres northeast of Timmins, hosts significant shallow platinum and palladium mineralization, and returned 762 ppb (Pt + Pd) over 1.93 metres, including 1.14 grams per tonne (Pt + Pd) over 0.5 metres from a depth less than 20-25 metres.

Tres-Or's diversified and experienced management and advisory team recently welcomed to its advisory board Dr. Harrison Cookenboo, P.Geo., and Dr. John Gammon, former Assistant Deputy Minister, Mines and Minerals Division, Ontario Ministry of Northern Development and Mines.

Tres-Or Resources Ltd. is a very well-positioned diamond exploration company that will appeal to investors looking for a diversified company with the experience and technical expertise to successfully develop diamond and other precious and base metal discoveries in Canada. ■
